The **dblfloatfix** package*

Morten Høgholm[†]

2012/12/31

This is the LaTeX package **dblfloatfix** which solves two problems:

a) floats in a `twocolumn` document come out in the right order and

b) allowed float positions are now `[tbp]`.

It may be distributed and/or modified under the conditions of the LaTeX Project Public License, either version 1.3c of this license or (at your option) any later version. The latest version of this license is in
`http://www.latex-project.org/lppl.txt`

Usage:

This package redefines internals of the LaTeX kernel by merging the code of the packages fixltx2e (the fix2col part) and stfloats.

If either of the packages stfloats or fix2col are loaded you will get an error message and your document will probably not be able to compile. So don't load them!

When the new output routine for LaTeX3 is done, this package will be obsolete. The sooner the better...

If you're using the subfigure package this package will provide a fix for `\end@dblfloat` by Steven Cochran (the author of subfigure).

---

[*]This manual corresponds to dblfloatfix v1.0a, dated 2012/12/31.
